

Please amend the Abstract with the following amended Abstract:

A data carrier-(1) for contactless communication with a communication station has a substrate-means (2) and a communication resonant circuit-(3) connected to the substrate-means (2) and consisting of a communication coil-(4) and of a capacitor configuration-(6) and having a resonant frequency-(f_R) which should have a nominal value, whereby enabling changing-means (9) ~~for changing the resonant frequency (f_R) being provided, which changing-means enable the~~ resonant frequency-(f_R) to be changed from an initial value both to higher frequency values and to lower frequency values.
